THE NEW BRUNSWICK GRADUATE FOLLOW-UP SURVEY REPORT - 1990

91-02704/

Dear Reader,

It is a pleasure to share with you the results of the 1990 Graduate Followup Study.

This year we maintained the three (3) new initiatives we began last year. That is, we conducted the survey by telephone, we asked the graduates to evaluate their training, and we produced the report in this new format.

And new for 1990 we expanded in two (2) areas. First, we surveyed graduates of the N.B. Craft School. While this institution is not a New Brunswick Community College, it is an institution administered by the Department whose graduates seek to earn their living through more artistic means. This survey provides feedback on the immediate readiness of that market for fresh graduates.

Secondly, we sought feedback from the graduates about student life and student services. This information will help us to plan and monitor these important aspects of the N.B. Community College experience.

The survey results are even more gratifying this year than last: while as many graduates are employed, higher proportions of them have jobs related to their training. This is the best kind of feedback for a Department whose mandate is to provide for the N.B. labour market.

Enjoy the report.

Sincerely,

LÉONARD J. ARSENAULT
DEPUTY MINISTER
N.B. DEPARTMENT OF ADVANCED EDUCATION AND TRAINING

THE NEW BRUNSWICK GRADUATE FOLLOW-UP SURVEY REPORT

1990

Prepared for

Planning Services
Department of Advanced Education and Training
Province of New Brunswick

Martha E. Patterson
Facts & Figures Research Services
Fredericton, N.B.

August 1990

FOREWORD

Some of the most important feedback indicators for our Department come to us each year through this Graduate Followup Study. From it we gain a sense of the job market for the skills our graduates have gained through the N.B. Community Colleges.

We also gain other things.

We have been conducting the same survey since 1983, so we now have a growing database from which we can plot our progress, spot trends, formulate longterm plans. And, through the addition of new questions to the survey, we are building new databases for more strategic planning activities.

A case in point is the evaluative feedback we requested for the first time last year. It worked so well that we added two (2) new questions: how would the graduate rate student services and student life at his or her college?

I would again like to thank the two consultant groups who helped us with this survey. Baseline Market Research for their professional telephone interviewing, which has permitted graduates to freely provide their opinions about their training. And to Facts & Figures Research whose skills in advanced technology provided us with this report in copy ready form - in French and in English - in four short months after receipt of the raw data. Congratulations to both groups.

Pamela Easterbrook-Nadeau

EXECUTIVE SUMMARY

The Department of Advanced Education & Training's Graduate Follow-up Survey was conducted by telephone for the second year in a row. From a survey population of two thousand and sixty-nine (2069) graduates, sixteen hundred and twenty-two (1622) were interviewed. Thus, recording the highest response rate in the history of the survey at seventy-eight percent (78%).

Ninety-three percent of graduates interviewed were in the labour force. Employment and employment in New Brunswick held steady at last year's levels. Both relation of work to training and average weekly full-time earnings increased.

Features this year:

* Evaluation includes two new categories: student services and student life.
* Earlier analysis: the time of first telephone call to completion of this report was six months, a three month improvement over last year's nine.
* NB Craft School graduates were included in this year's survey population; graduates of Upgrading programs were not.

Trends:

* The labour force participation rates of male and female graduates which have been moving towards each other in recent years, met this year (93%).
* Women's employment rate continued to increase; men's held steady.
* Full-time and part-time employment had the same shares of all employment as last year's survey.
* Graduates reported greater occupational diversity this year than last. On the other hand, their industrial concentration was also greater.
* Increases in average weekly earnings were due to gains by employed female graduates.
* A greater percentage of employed graduates had permanent jobs.
* All clusters but two had eighty-five percent or more of their employed graduates working in New Brunswick.
* A declining proportion of graduates in the survey population had their training CEIC-sponsored.

Trends to Watch:

* Men's full-time employment is declining while women's is on the rise.
* Two percent of employed graduates were self-employed compared to one percent last year.
* A high percentage of graduates had jobs or found one within ten weeks of searching. This topic will be pursued next year, asking questions about how the job was found.
* After three survey years of growing proportions of graduates taking further study, this year the proportion (and actual number) declined.

SURVEY BACKGROUND

The labour market experiences of graduates from programs at the New Brunswick Community Colleges have been tracked through the graduate follow-up survey since 1983. Every March graduates from regular training programs (at least 20 weeks in duration) of the previous academic year are contacted. They would have graduated at least nine (9) months earlier.

This year, in addition to surveying the graduates of the nine community colleges, graduates from the New Brunswick Craft School also participated in the survey.

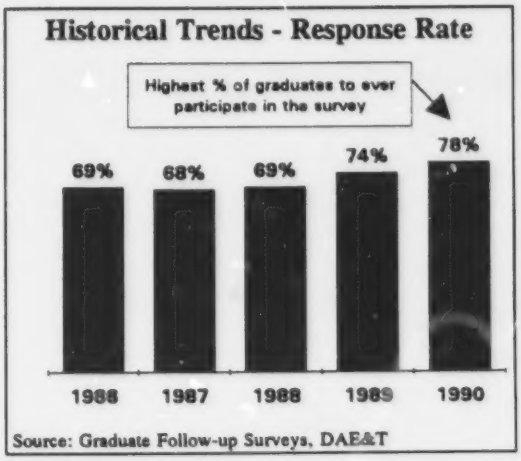
Annually, the questionnaire is refined and data requests streamlined. Background information on graduates may be obtained through a cross-reference of records with the Student Information System (SIS). Thus, the survey is able to focus upon their activities since graduation.

Revisions to the questionnaire were not as extensive this year as last. However, a few questions were deleted or re-worded. The evaluation section was expanded to include two new categories, student services and student life. The question concerning overall impressions was dropped. The only other change was the exclusion of Upgrading programs from this year's survey population.

Following last year's format, this report provides a profile of the graduates followed by an overview of the survey results. The factsheets are preceded by a User's Guide. Factsheets are included for each college, cluster and program in addition to a summary factsheet. Summary tables conclude the report.

RESPONSE RATE

For the second year in a row, the graduate follow-up survey was conducted by telephone. Furthermore, the response rate increased from 1989's 74% to 78% this year, the highest response rate in the history of the survey. There were two thousand and sixty-nine (2069) graduates in the survey population; sixteen hundred and twenty-two (1622) were interviewed. Male and female graduates were equally represented, 1036 and 1033 respectively.

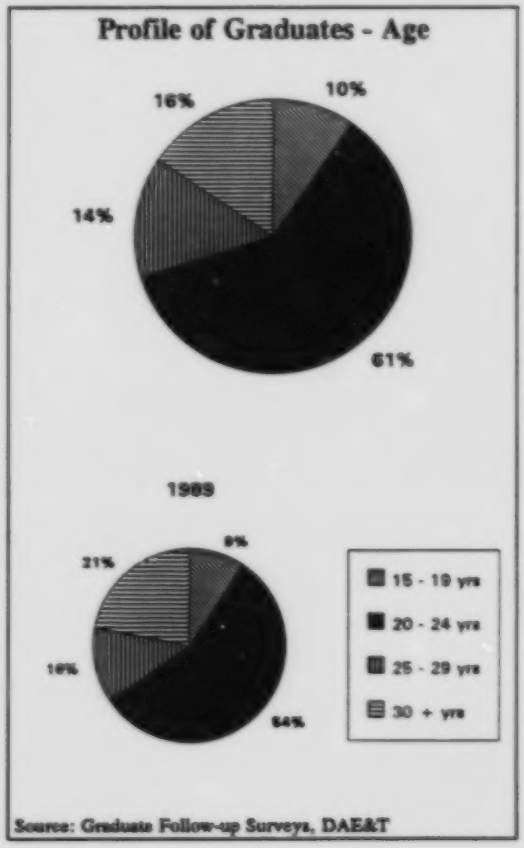


PROFILE OF GRADUATES

The profile of graduates in 1990 showed a more traditional population than the 1989 survey. There was a greater percentage of single (never married) students. There were also fewer older graduates as well as fewer graduates with post-secondary education. While participants in upgrading programs were likely to be older, with more education and a marital status other than single, a closer look at the influence of their participation indicated that they would not have accounted for all of the movement back to a more traditional profile of graduates.

Age

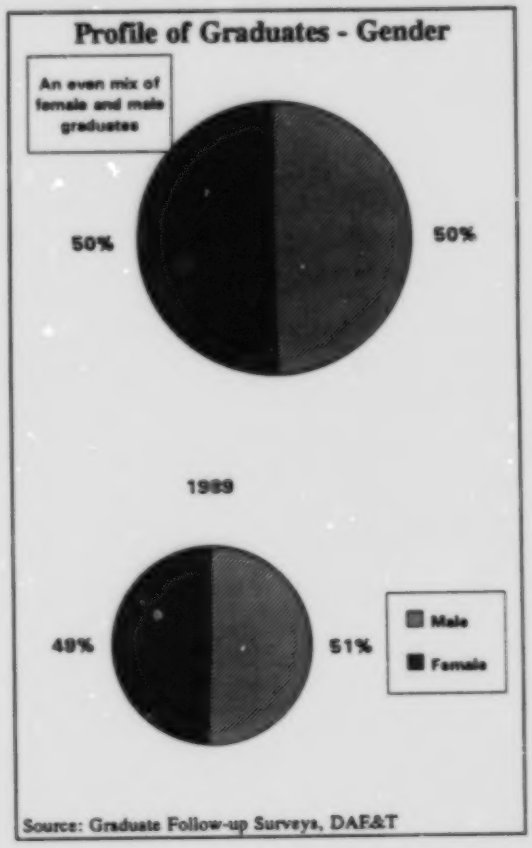
A larger proportion of graduates in this year's survey were 20 - 24 years old, 61% vs 54% in 1989. The graduates over thirty years of age were again the second largest group, but their proportion was smaller this year (16% compared 21% in 1989). An estimate of the inclusion of upgrading graduates would have changed these proportions to 58% and 19% respectively: so the trend towards younger graduates still holds.



Gender

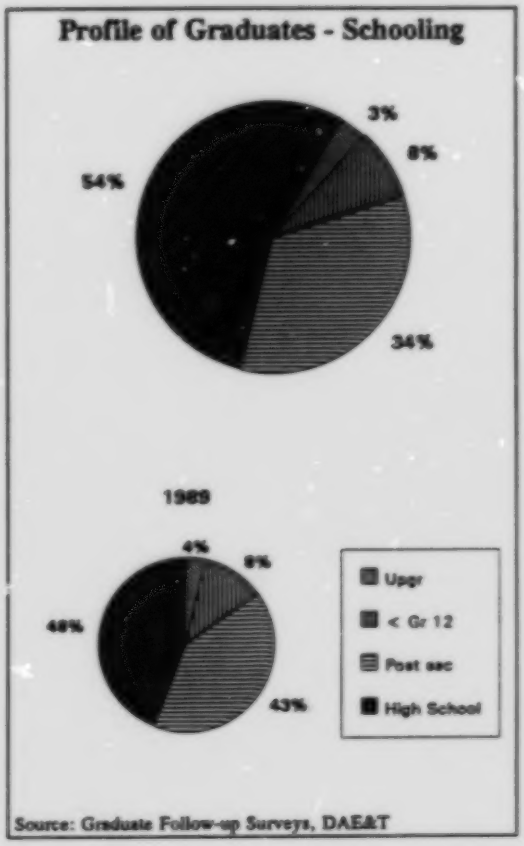
Both sexes were equally represented. The inclusion of the upgrading programs would have only marginally altered these proportions, 51% male and 49% female.

While an even number of women and men graduated from the regular training programs, it was interesting to note that the majority of programs were clearly either female- or male-dominated. Only two clusters of programs, Hospitality/Tourism and Business had less than seventy-five percent either male or female students.



Schooling

Graduates with high school as their highest level of education prior to training continued to dominate the profile of the graduates. Furthermore, their share was larger this survey (54%) than in 1989 (46%). One-third of graduates in the survey had some post-secondary training. Again, the inclusion of upgrading programs would have only slightly varied the results, 52% high school and 36% post secondary.

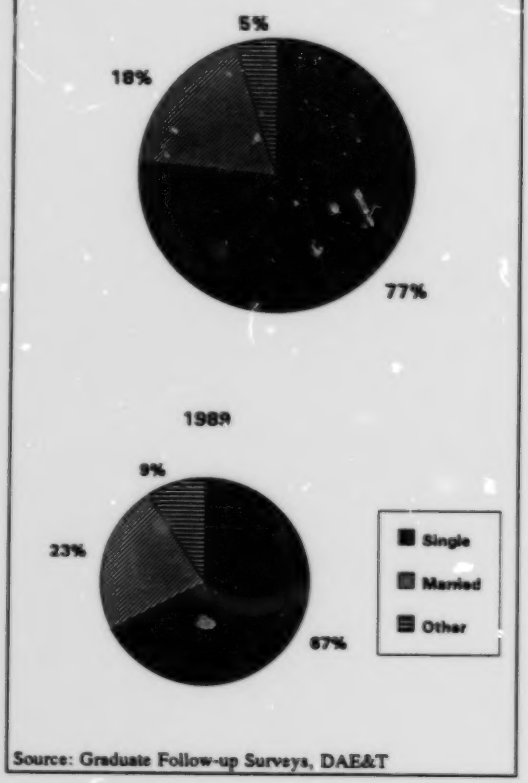


Marital Status

Over the past three survey years, the percentage of graduates who were single (never married) has been gradually declining. This year, however, more than three-quarters of graduates were single. Not surprisingly, the second largest group of graduates were married. However, they dropped in their share from 23% in 1989 to 18% this year.

The percentage of graduates with dependents also declined. Seventeen percent (17%) of graduates had dependents at the time of the survey, compared to twenty-five percent (25%) in the 1989 survey.

Profile of Graduates - Marital Status



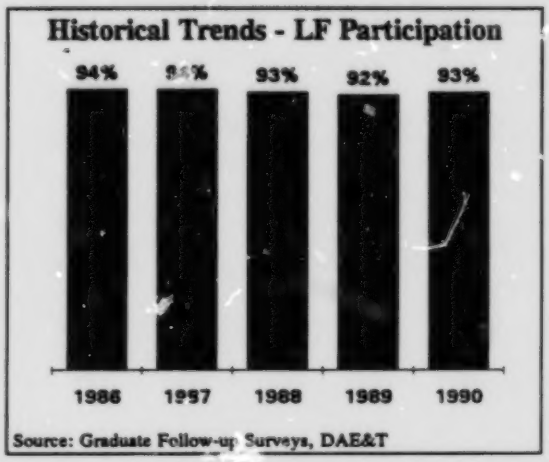
Source: Graduate Follow-up Surveys, DAE&T

LABOUR FORCE PARTICIPATION

NBCC graduates were intent upon putting their training to work. Their labour force participation rate of ninety-three percent (93%) remains much higher than the New Brunswick participation rate of sixty-one percent.

After two survey years of a marginal decline each year in the labour force participation rate of graduates, this survey year the rate returned to its 1988 level of ninety-three percent (93%).

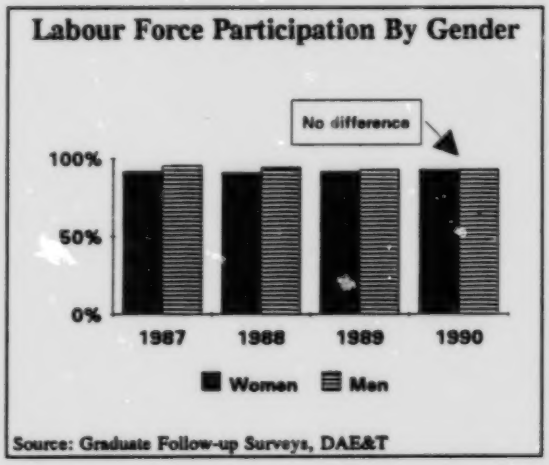
Thus the percentage of graduates not in the labour force has declined to seven percent of graduates. Furthermore, the percentage not in the labour force because of full-time study has also declined. Two-thirds of the graduates not in the labour force were studying full-time this year compared to more than eighty percent in the 1989 survey. The other graduates not in the labour force were either ill/disabled or tending to personal/family responsibilities.



Gender

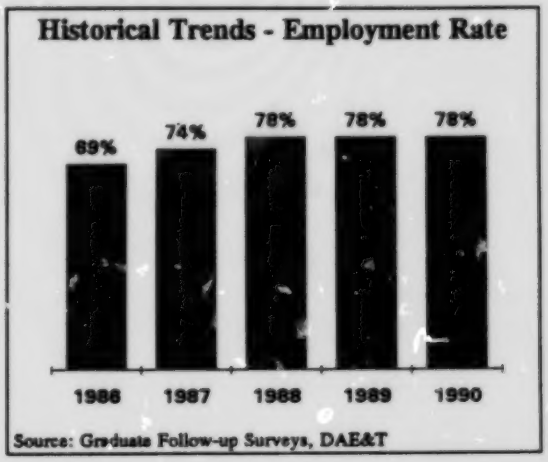
For the first time in the history of the survey, female and male graduates had the same labour force participation rate at ninety-three percent (93%). The gap that has been narrowing the past two survey years has now closed. Female graduates increased their labour force participation this year while male graduates held steady.

Of those graduates not in the labour force, there were almost equal numbers of men (53) and women (54).



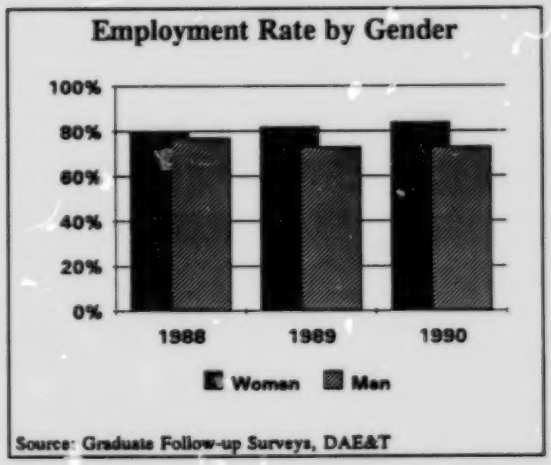
EMPLOYMENT

Graduates have maintained an employment rate of seventy-eight percent (78%) for the past three survey years.



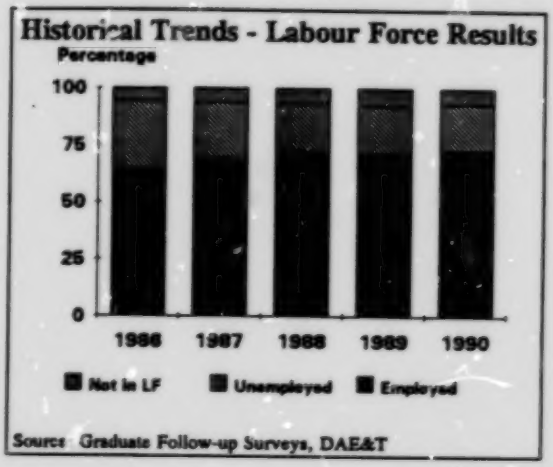
Gender

Again, this year, women reported a higher employment rate than men. Moreover, the gap has widened. Women increased their employment rate from eighty-two percent (82%) in 1989 to eighty-four percent (84%) this year. Men's employment rate, on the other hand, did not increase from their 1989 level of seventy-three percent (73%).



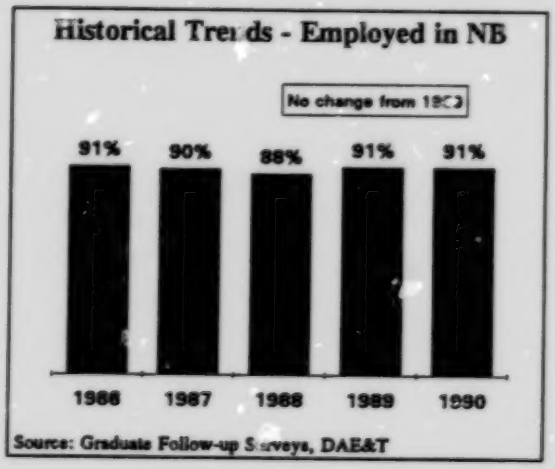
Labour Force Activity

Employment and non-labour force participation have been accounting for an increasingly larger proportion of the labour force activity of graduates, with unemployment on the decline since the survey began. The proportions have been steady over the past three years.



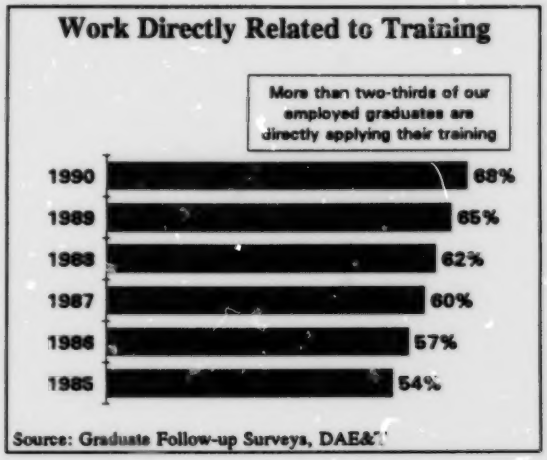
Employment in New Brunswick

Nine out of every ten employed graduates were working in New Brunswick. For the second year in a row, employment in New Brunswick was at ninety-one percent (91%).

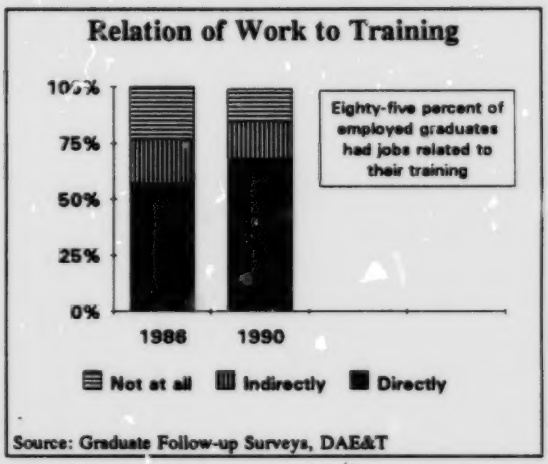


Relation of Work to Training

Every year since 1983, an increasingly higher percentage of employed graduates have directly applied their training. This survey was no exception. Fully sixty-eight percent (68%) of employed graduates had jobs directly related to their training, a three point increase since last year.

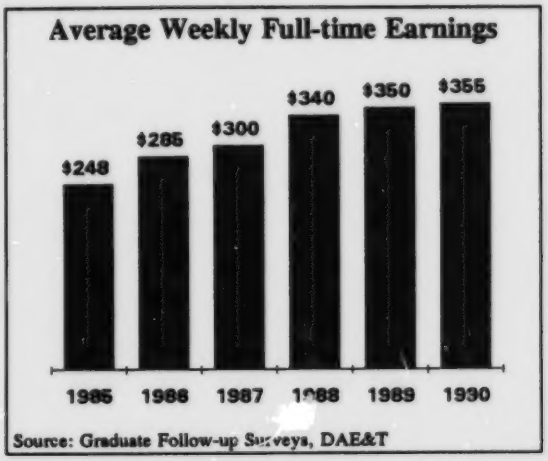


Furthermore, combining the directly and indirectly related responses, eighty-five percent of employed graduates had jobs related to their training. The trend over the years is for jobs either "indirectly" or "not at all" related to training to decline, in favor of jobs directly related to training.



Average Weekly Full-time Earnings

Once again, average reported full-time earnings have increased. This year the average weekly earnings for full-time employment was $355, up slightly from last year's $350 average.

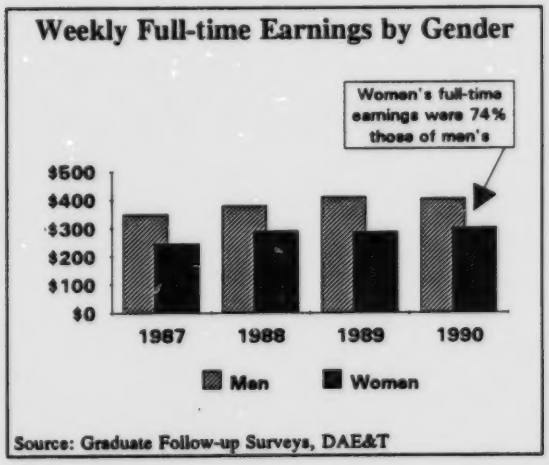


Gender

Female graduates reported full-time earnings of $300 per week, an increase from $285 in 1989. Men maintained their 1989 level at $405 per week.

Women continue to earn less than men. However, the gap narrowed this year. Female graduate's full-time earnings were seventy-four percent (74%) of those of men's, compared to seventy percent (70%) in the 1989 survey.

More than eighty percent of employed graduates working full-time volunteered weekly earnings information. Of employed men working full-time, eighty-four percent (84%) reported their earnings, compared to seventy-eight percent (78%) of employed women working full-time. Do low weekly earnings account for women's inclination to not disclose this information?

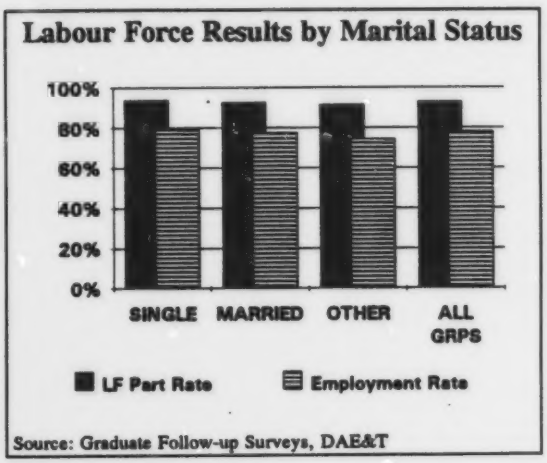


AGE

Only the graduates over the age of thirty had a labour force participation rate below ninety-four percent. This was the same group with the lowest employment rate (74%). The other three age groups had the same labour force participation rate at 94% with employment rates within three percentage points of each other, 78% to 81%.

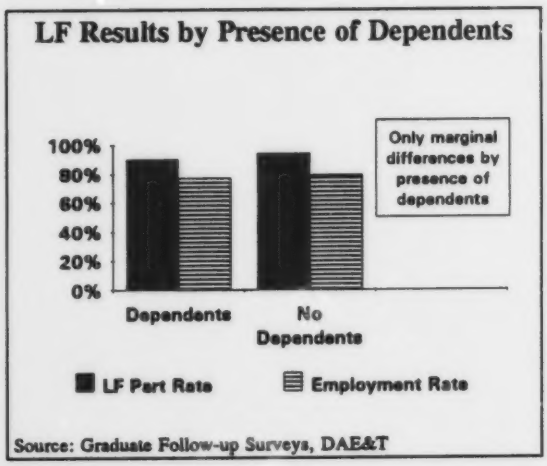
MARITAL STATUS & DEPENDENTS

As indicated in the profile of graduates, seventy-seven percent (77%) were single, eighteen percent (18%) were married and the remaining five percent (5%) were either separated, divorced, widowed or other. There was little variation in labour force participation by marital status with single and married graduates at 94% and 93%. The "other" group had the lowest rate at 91%. Their employment rates had a wider range: from 74% for "other" to 79% for single graduates in the labour force.



Dependents

Seventeen percent of graduates had dependents. Their labour force participation and employment rates were only slightly lower than those of graduates without dependents.



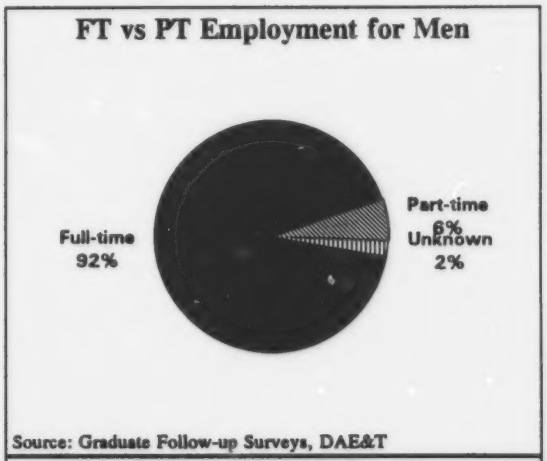
JOB STATUS

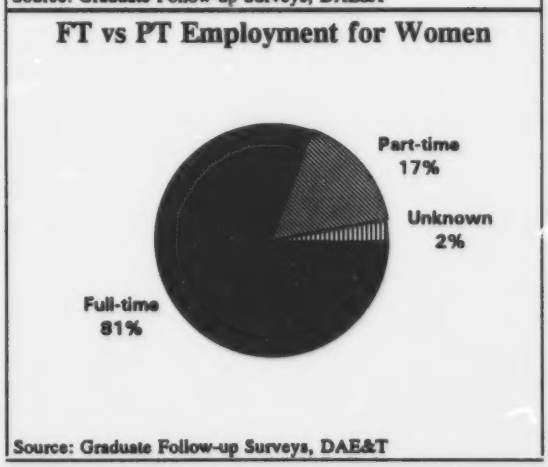
As in the 1989 survey, eighty-six percent (86%) of employment reported this year was full-time. Part-time employment also maintained its 1989 level at twelve percent (12%) of all employment.

Again this year, it was more likely for graduates working part-time (29%) to have jobs not at all related to their training than for those working on a full-time basis (12%).

Gender

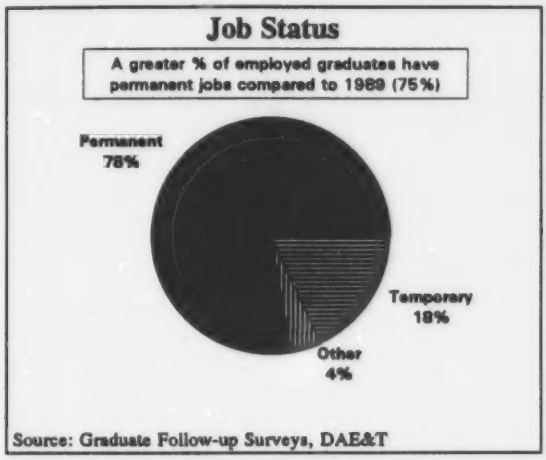
Women were more likely than men to work on a part-time basis. However, the percentage of men employed full-time declined to ninety-two percent (92%) this survey from ninety-four percent (94%) the previous year. Furthermore, a greater percentage of employed female graduates worked full-time (81% vs 79% in 1989). Of those graduates working on a part-time basis, seventy-eight percent (78%) of them were female.





Permanency of Work

A greater percentage of employed graduates had permanent jobs. Seventy-eight percent (78%) of employed graduates indicated that they were permanent employees, up from 75% in 1989. Self-employment also increased from one percent (1% or 16 graduates) of employed graduates to two percent (2% or 25 graduates) this year.

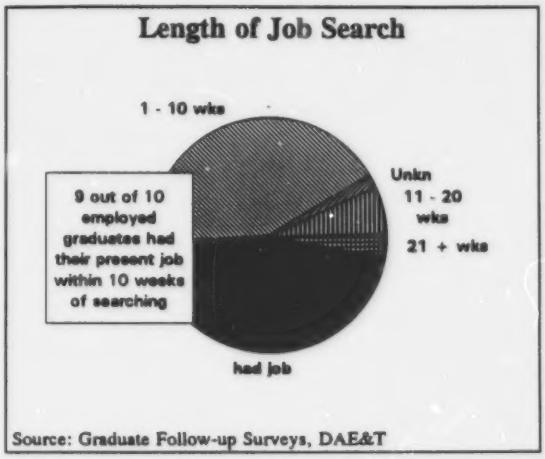


Job Status
A greater % of employed graduates have permanent jobs compared to 1989 (75%)
Permanent 78%
Temporary 18%
Other 4%
Source: Graduate Follow-up Surveys, DAE&T

JOB SEARCH

Nine out of every ten graduates had their present job within ten (10) weeks of searching for employment. Also, almost half of employed graduates reported having begun work immediately. This means that these graduates either had their job already or were approached directly by the employer. This was a dramatic increase over the 1989 survey when twenty-three percent of employed graduates had jobs when they completed their training.

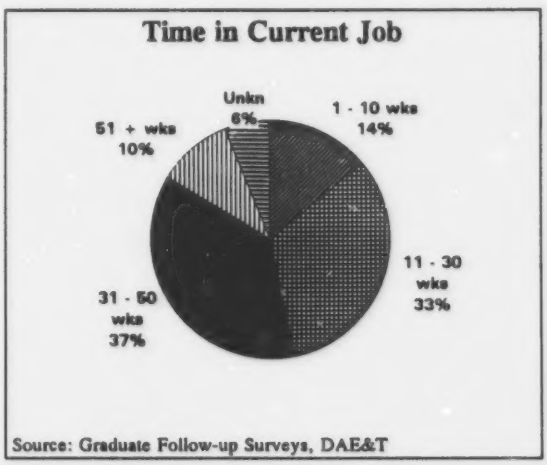
This would indicate that once graduates begin their job search, they are absorbed into the labour force within a relatively short period of time. However, there was a small change in the wording of the question this year. Thus, in order to really know what is happening, this topic may be expanded next year to determine how graduates found their job. For example, how many graduates work for the employer for whom they did their practicum?



Length of Job Search
1 - 10 wks
Unkn
11 - 20 wks
21 + wks
9 out of 10 employed graduates had their present job within 10 weeks of searching
had job
Source: Graduate Follow-up Surveys, DAE&T

Time in Job

Almost half of employed graduates had been working at their present job for at least thirty-one weeks. Again, this indicates a ready job market at the time of graduation.



SURVEY RESULTS BY COLLEGE

The survey results by college did not show as much variation this year as last.

Response Rate

The thirty percentage points spread in response rates by college of 1989 was not repeated this year. Miramichi had the highest response rate at eighty-three percent (83%) followed closely by Bathurst at eighty-two percent (82%). The lowest response rate was seventy-four percent (74%) for St. Andrews, giving an overall nine point spread.

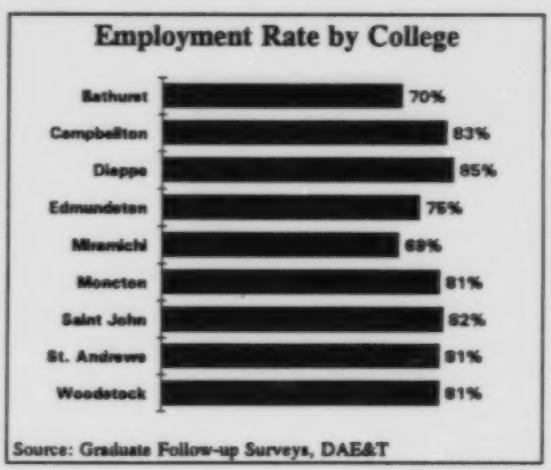
Labour Force Results

Miramichi with one of last year's lowest labour force participation rates (87%) had the highest rate this year at ninety-eight percent (98%). Once again, Saint John graduates maintained their high labour force participation at ninety-six percent (96%). Only Edmundston (87%) had a labour force participation rate lower than ninety percent.

As in the 1989 survey, Miramichi had the lowest employment rate at sixty-nine percent (69%) while Dieppe again had the highest employment rate (85%). However, Miramichi's employment rate increased slightly over last year's (67%) while Dieppe's declined (95% in 1989). As a result the total range of employment rates across the colleges was much smaller this year.

The Moncton (86%) and Edmundston (87%) colleges again this year had fewer than ninety percent of their employed graduates working in New Brunswick. And for the first time, so did the Bathurst college (89%).

On the other hand, more than ninety-five percent of employed graduates from the Saint John and Woodstock colleges worked in New Brunswick.

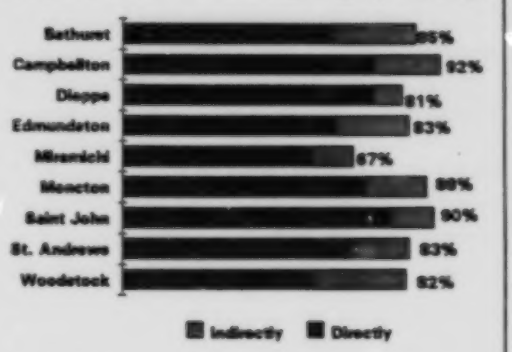


For the "related" employment graph, work "directly" and "indirectly" related to training were combined. Graduates of the Campbellton (92%) and Saint John (90%) colleges reported the greatest success in finding employment related to their training. In fact, all colleges except Miramichi (67%) had more than eighty percent of their employed graduates with jobs related to training.

Considering the category "directly" related jobs alone, seventy-eight percent (78%) of employed graduates from the Saint John college had jobs directly related to their training, well above the 68% average for the year.

The Factsheets provide more detailed results for each college.

Relation of Work to Training by College



Source: Graduate Follow-up Surveys, DAE&T

NB CRAFT SCHOOL

The NB Craft School is a nationally acclaimed specialized post-secondary institution. Candidates pass rigorous entrance requirements to gain admittance into the institution. Once there, they pursue their "craft" as opposed to a "trade". Self-employment is more likely to be the sought-after outcome rather than an employee/employer relationship.

Prior to its inclusion in the graduate follow-up survey, the NB Craft School conducted its own in-house survey of the fifty-six (56) graduates from the past five years , 1984-1985 to 1988 - 1989, to determine what these graduates were now doing. The whereabouts of three-quarters (42) of the graduates were known.

Thirty-two of the graduates (or 75%) were working with their craft either on a full-time or part-time basis. Half of them (16) were self-employed.

There were nineteen graduates in this year's graduate follow-up survey population. Twelve of them were interviewed. Of the ten graduates in the labour force, seven were employed, all but one in New Brunswick. Four (or 57%) of the employed graduates had work related to their training. However, it is not known whether they also continue to develop their craft outside of their present job.

SURVEY RESULTS BY CLUSTER

All programs offered at the colleges are assigned to one of 18 clusters of study. In the 1990 survey, programs from sixteen clusters were surveyed. As was the case last year, programs in the Academic Upgrading cluster were not included in the survey population nor were there any programs in the Heavy Equipment Operation cluster to be surveyed.

Gender Domination

All the clusters, except for Business and Hospitality/Tourism, were clearly dominated by either one gender or the other. The definition of "domination" was that at least three-quarters of students in the cluster were one gender. Furthermore, eight clusters had more than 90% representation by one gender.

Cluster	% Male	% Female
Construction	93%	7%
Electronics	98%	2%
Heat, Vent & Air Conditioning	97%	3%
Mechanical - Industrial	93%	7%
Mechanical - Motorized Equip	97%	3%
Metals	99%	1%
Personal Services	5%	95%
Secretarial/Clerical	5%	95%

The only notable differences this year compared to the distribution of students by gender in the 1989 survey population came with the Natural Resources and Protective Services clusters. The representation by female students dropped in both clusters: From 28% to 16% in Natural Resources and from 43% to 21% in Protective Services. This would suggest a move away from non-traditional programs of study.

Labour Force Results

All clusters but three had more than ninety percent of their graduates in the labour force. Protective Services went from the cluster with the lowest labour force participation rate in the 1989 survey (78%) to the one with the highest participation rate this year at 100%. Mechanical-Industrial was next highest with ninety-nine percent (99%) of its graduates in the labour force. The lowest participation rate (87%) was recorded by graduates from two clusters: Applied Arts & Communication and Natural Resources.

Electronics had the highest employment rate at ninety-two percent (92%). Health/Community Services (87%) and Business (86%) were next in line. Wood & Related Materials again reported the lowest employment rate at forty-one percent (41%). This was lower than its rate in the 1989 survey (58%). Consistent with the 1989 survey, Construction and Metals also had low levels of employment at 61% and 65% respectively.

Two clusters, Protective Services and Wood & Related Materials had all of their employed graduates working in New Brunswick. Health/Community Services (96%) was close behind. Only two clusters, Electronics (74%) and Metals (78%) had more than twenty percent of their employed graduates working outside the province compared to four clusters in the 1989 survey.

Three clusters had more than ninety percent of their employed graduates working in jobs related to their training: Health/Community Services (97%), Business (93%) and Metals (91%). Again this year, Heating, Ventilation & Air Conditioning (64%) gave one of the poorest showings along with Applied Arts & Communications (67%).

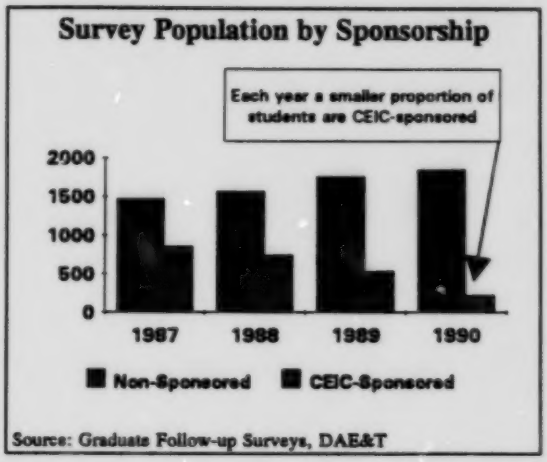
The Factsheets provide more detailed results for each college.

SPONSORSHIP

Over the years the proportion of students in regular training programs having their training financially supported by Employment & Immigration Canada (EIC) has been on the decline. This year the proportion significantly dropped once again. Only eleven percent (11%) of graduates in this year's survey population were CEIC-sponsored compared to twenty-three percent (23%) in the 1989 survey and thirty-two percent (32%) in the 1988 survey population.

Even the inclusion of graduates from the upgrading programs would only have marginally altered these proportions, where CEIC-sponsored graduates would have represented twelve percent (12%) of the total survey population instead of eleven percent (11%).

Because the CEIC-sponsored graduates represented so small a proportion of the total survey population, the labour force comparisons by sponsorship were discontinued this year.



OCCUPATIONS

Forty percent (40%) of employed graduates were working in ten occupational categories. This is a reduced occupational concentration than last year's (43%).

Gender

Men continued to exhibit more occupational diversity than female graduates. Employed male graduates returned to their 1988 level with forty percent (40%) employed in ten occupational groups. Their 1989 level was at forty-two percent (42%). On the other hand, fifty-nine percent of employed women worked in ten occupational groups. This was lower than the two previous surveys, at 64% in 1989 and 60% in 1988.

INDUSTRIES

While there was less occupational concentration this year, there was an increase in the industrial concentration of employment. Fifty-four percent (54%) of employed graduates worked in ten industrial categories, compared to fifty-two percent (52%) in the previous year's survey. Furthermore, the number of industrial classifications identified declined from sixty-four (64) in the 1989 survey to 59 this survey.

Health & Social Services

Again this year, the largest percentage of employed graduates (12%) worked in health & social services industries. However, this has declined from fourteen percent (14%) in 1989.

Gender

For both male and female graduates, eight of their top ten industrial categories were the same as those in the 1989 survey. Female graduates were more concentrated this year with sixty-six percent (66%) in ten industrial groups compared to 64% last survey. Employed male graduates, on the other hand, declined in their industrial concentration from 54% in 1989 to fifty-two percent (52%) this year.

FURTHER STUDY

Nine percent (9%) of all graduates (or 153 graduates) were taking further studies. This was the first year in four surveys for the percentage to decline, from 10% in 1987 to 11% in 1988 and then 12% last year to this year's 9%. The impact that upgrading programs would have had on this result was not measurable.

Reasons

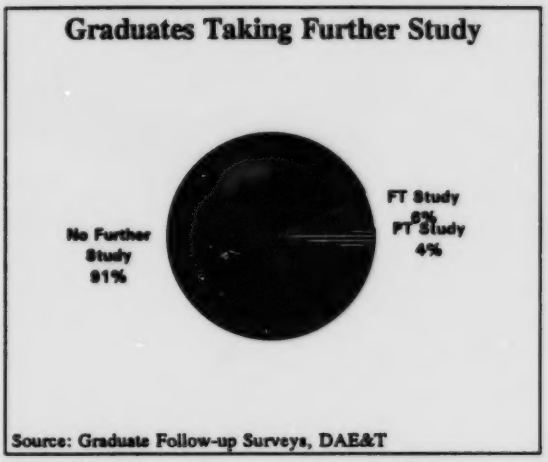
Fifty-five percent (55%) of those graduates taking further training wanted to upgrade their existing skills. This was higher than last year's forty percent (40%). Interestingly, the next most common reason was to obtain a university degree (12% or 19 graduates). This has not been a popular reason before.

Full-time Study

A greater proportion (61%) of those taking further study were studying on a full-time basis this year, compared to last year (55%).

Programs

Sixty-three of the one hundred and twelve programs surveyed had at least one graduate taking further training.

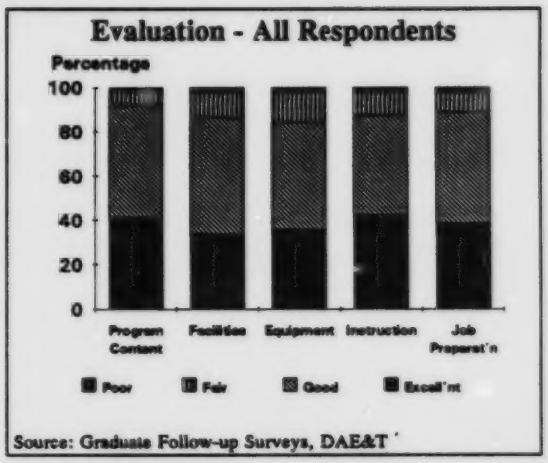


Highest # of graduates taking further study	
Stenographer	13
Business Tech - Accounting	10
Machinist	7
Accounting Clerk	7
Nursing Assistant	6
Motor Vehicle Repair (Mech)	6
Beauty Culture	5

EVALUATION RESULTS

Once again, graduates were asked to evaluate their training according to program content, facilities, equipment, quality of instruction and preparation for a job. In addition to these five categories, two new ones were added this year: student services and student life. The question on overall impression of training was dropped.

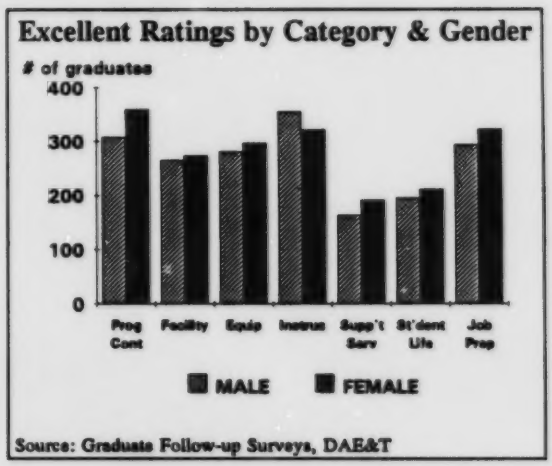
Examining last year's evaluative categories, job preparation was the only one varying by more than one percentage point from last year's ratings. Eighty-eight percent (88%) of graduates rated preparation for a job as excellent or good compared to eighty-five percent (85%) in the 1989 survey. Program content (91%) again received the most favorable rating , equipment the lowest (83%). However, when only the excellent responses were examined, quality of instruction came out on top.



Source: Graduate Follow-up Surveys, DAE&T

Gender

The responses of male and female graduates were quite similar. Women gave the highest excellent rating to program content whereas male graduates favored quality of instruction.



Source: Graduate Follow-up Surveys, DAE&T

Student Services & Student Life

The two new evaluative categories received the lowest ratings at 73% excellent/good for student services and 79% excellent/good for student life.

They also received the highest percentage of no responses: 9% or 151 graduates for student services and 4% or 59 graduates for student life. No responses for the other five categories were at one percent of graduates or fewer. Thus, it is possible that graduates were not clear on the intent of these two categories. For this year, it throws up the "red flag" on student services and student life. Having comparative results next year will shed more light on the correct interpretation of this information.

Evaluative results for each college, cluster and program are located in the Factsheets.

USER'S GUIDE TO FACTSHEETS

Again this year, factsheets have been prepared for each college, cluster and program as well as a summary factsheet. Compared to the 1989 factsheets, very little has changed with respect to format. Program evaluation has two new categories this year, student life and student services. These interpretative notes explain to readers the information they will find in each factsheet.

The college(s) where training took place is identified for the program factsheets only.

A written commentary for each factsheet highlights significant findings. Included are any references to part-time employment and, where relevant, comparisons to the 1989 survey results.

Survey Population: The number of graduates surveyed by gender and those participating are identified in this section. A response rate has also been calculated.

Labour Force Results: All survey participants are categorized according to their reported labour force activity. Depending upon their answers, respondents are classified as either employed, unemployed or not in the labour force. "Not in the labour force" is defined as anyone who is studying full-time, or not working because of illness/disability or personal/family responsibilities. All other respondents who are currently not working are considered to be unemployed.

The labour force is the sum total of the employed and the unemployed. The employment rate is determined by dividing the employed respondents by the total labour force, expressed as a percentage. The unemployment rate, therefore, is calculated by dividing the unemployed respondents by the total labour force, expressed as a percentage.

Employment: This section was expanded in the 1989 factsheets and the format remains unchanged this year. All percentages are with respect to total employed.

Employed participants are asked several questions concerning their job. Here location of work, employment status, type of employment and the relationship between their job and their training are presented.

Any respondent working more than 29 hours per week is considered to be working full-time. Average weekly earnings for full-time employment are calculated. Not all respondents provide wage information. The number that do is located next to the figure for average weekly earnings. The average number of part-time hours is also presented along with the number of graduates working part-time.

Program Evaluation: The 1989 survey was the first one to ask graduates to evaluate their training. Evaluation was expanded this year to include student services and student life as well as last year's categories of program content, facilities, equipment, quality of instruction and preparation for a job. This table presents the percentage of graduates who rated these variables as either excellent or good.

Most Common Occupations: The three most common occupations for each factsheet are given.

Most Common Industries: The three most common industries for each factsheet are given.

Unemployment: The unemployed respondents are asked the reason they are not currently working. The three most common reasons are given.

NEW BRUNSWICK

The survey response rate increased to 78%, the highest rate in the history of the survey. For the 3rd consecutive year, the employment rate was 78%. Same as last year, 91% of employed graduates worked in New Brunswick. Two new categories were evaluated: student services and student life. Also new this year was the inclusion of graduates from the NB Craft School.

BATHURST

More than 80% of graduates from this college were interviewed. Consistent with the 1989 survey, 70% of graduates in the labour force were employed. The spread between the employment rates of women (78%) and men (64%) narrowed this year, compared to 1989 (84% and 59% respectively). Employment and evaluation results for this college were in line with overall results.

SMALL BUSINESS MANAGEMENT

Dieppe

Six of the 8 graduates of this program were interviewed. Four of them were in the labour force. However, only one graduate was employed. The three unemployed graduates were waiting recall from a layoff. While all the graduates thought that program content and equipment were excellent/good, only half of the graduates thought the same about quality of instruction.

COMPUTER AIDED DRAFTING & DESIGN

Bathurst

All four graduates participated in the survey. Half of them were employed. This was lower than the employment rate of the 1989 survey (78%) but the survey population was also much smaller this year. The two employed graduates had permanent full-time jobs directly related to their training. Three of the seven evaluation categories were highly rated by all the graduates.

GENERAL DRAFTING

Moncton

Three-quarters of the graduates of this program participated in the survey. Their employment rate was below average as well as lower than last year's rate (100%). All eight employed graduates worked in New Brunswick. However, only half had permanent jobs. Overall, evaluation results were below average. Job preparation received a similar low rating last year (59%).

GERIATRIC AIDE

Bathurst

More than 80% of graduates of this program participated in the survey. Both labour force participation and employment were below average, the latter was lower than the 1989 rate (68%). All employed graduates had jobs in New Brunswick directly related to their training. Only 2 worked full-time. Again this year, facilities received the lowest rating.

METALS

This cluster had a response rate of 80%. Again this year, these graduates had a low employment rate. Relation of full-time work to training was very high at 79%. The percentage of employment in New Brunswick dropped considerably from 96% in 1989 to 78% this year. Again this year, graduates from this cluster reported the highest average earnings.

WELDING

Bathurst Moncton Saint John

This program had an above average response rate. Half of those in the labour force were employed, a drop from the 1989 survey (64%). Reported earnings were also lower than in 1989 ($563). The exclusion of WELDING - UPGRADING from this survey population may partially explain these less favorable results. Graduates gave generally high ratings.
